description

Th SN54HC375 and SN74HC375 bistable latches are electrically and functionally identical to the SN54HC75 and SN74HC75, respectively. Only the arrangement of the terminals has been changed in the SN54HC375 and SN74HC375.

These latches are ideally suited for use as temporary storage for binary information between processing units and input/output or indicator units. Information present at a data (D) input is transferred to the Q output when the enable (C) is high and the Q output will follow the data input as long as the enable remains high. When the enable goes low, the information (that was present at the data input at the time the transition occurred) is retained at the Q output until the enable goes high.

The SN54HC375 is characterized for operation over the full military temperature range of −55°C to 125°C. The SN74HC375 is characterized for operation from −40°C to 85°C.

†Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
